

College Event Reminder Automation System using n8n

Problem Statement

Students often miss important college events, workshops, hackathons, and placement drives because announcements are scattered across multiple platforms such as emails, WhatsApp groups, and notice boards. As a result, students may miss registration deadlines and valuable opportunities.

The objective of this project is to develop an automated event reminder system that continuously monitors event information stored in a Google Sheet and automatically sends reminder emails to students before important deadlines.

Proposed Solution

The College Event Reminder Automation System uses n8n to automate the process of tracking and notifying users about upcoming events.

The workflow reads event details such as event name, registration deadline, event date, and status from a Google Sheet. The retrieved information is then processed and sent as automated email reminders through Gmail.

This eliminates manual tracking of events and ensures that students receive timely notifications about upcoming opportunities.

Objectives

- Automate event tracking and reminder generation.
- Reduce the chances of missing registration deadlines.
- Improve student awareness of upcoming events.
- Demonstrate workflow automation using n8n.
- Integrate cloud services such as Google Sheets and Gmail.

Technologies Used

- n8n (Workflow Automation)
- Google Sheets (Event Data Storage)
- Gmail API (Email Notifications)
- Google OAuth 2.0 (Authentication)

Workflow

1. Event details are stored in Google Sheets.
2. n8n reads event information from the sheet.
3. Event details are processed automatically.
4. Gmail sends reminder emails to the user.
5. Users receive notifications regarding upcoming events.

Expected Outcome

The system successfully automates event reminders and reduces the effort required to manually monitor college announcements. Users receive timely email notifications about important events and deadlines.
